Notes: The models are specified by the informal ID-formal ID measures used in the regression. MD=Mahalanobis distance; KS=Kogut & Singh distance; ED=Euclidean distance; PCA=Absolute distance based on the index created via PCA; FA=Absolute distance based on the index created via FA. N is the number of observations and r2\_o the overall R<sup>2</sup>. Clustered robust standard errors in parentheses. \*p<0.10; \*\*p<0.05; \*\*\*p<0.01.

Notes: The models are specified by the informal ID-formal ID measures used in the regression. MD=Mahalanobis distance; KS=Kogut & Singh distance; ED=Euclidean distance; PCA=Absolute distance based on the index created via PCA; FA=Absolute distance based on the index created via FA. N is the number of observations and r2\_o the overall R<sup>2</sup>. Clustered robust standard errors in parentheses (by host countries). \* $p < 0.10$ ; \*\* $p < 0.05$ ; \*\*\* $p < 0.01$ .

Notes: The models are specified by the informal ID-formal ID measures used in the regression. MD=Mahalanobis distance; KS=Kogut & Singh distance; ED=Euclidean distance; PCA=Absolute distance based on the index created via PCA; FA=Absolute distance based on the index created via FA. N is the number of observations and r2\_o the overall  $R^2$ . Clustered robust standard errors in parentheses (by host countries). \* $p < 0.10$ ; \*\* $p < 0.05$ ; \*\*\* $p < 0.01$ .
